

Running BASH in Windows

There are many options available on learning and using BASH Shell under the Windows environment. In order to not provide the many different options, we will use Cygwin (<https://cygwin.com/index.html>). Install Cygwin on your Windows machine by Week 9. You will need this for the rest of this Unit as well as for Assignment 3.

Running BASH in MacOS

If you are using MacOS Big Sur (or later), your terminal should be by default `zsh`. Prior to Big Sur, the terminal should be a BASH terminal. If you are using the latest MacOS, all you need to do is to run

```
chsh -s /bin/bash
```

Note that MacOS is technically a UNIX variant, much like Linux.
